

How to run a script in All Orders

Last Modified on 03/31/2021 3:28 pm EDT

The admin user has the ability to run scripts from the All Orders user interface to update the database. Scripts may come in one of two forms, a file or a block of text that can be copied and pasted. Here is how to run both!

-Open All Orders as the admin user.

-From the File menu select Maintain and then click the Advanced tab and then the Run DB Command button.

-For a Script File click the browse button, select the script file and then click the Run button.

-For a block of text copy the entire script and paste it into the entry box on the Run Command screen and then click the Run button.
