

AO Web Address by name

Last Modified on 03/31/2021 3:29 pm EDT

Be sure to setup a sub domain to point to your fresh new All Orders product website to make it easily accessible outside your local network.

For example, if my website was [bakery.com](#) I might setup [orders.bakery.com](#) for my wholesales customers to log into my All Orders Web website.

I would simply need to go to wherever I have my domain name registered (such as GoDaddy or Network Solutions) and point the [orders.bakery.com](#) sub domain to my public IP address where the website is being hosted (in our example 234.567.890.345 which we got from [ipchicken.com](#)).

Then whenever anyone wanted to go to the website, instead of needing to know the IP address they can use:
<http://orders.bakery.com/AOWeb/Admin/Login.aspx>

Below is a link to the GoDaddy guide to adding a subdomain to your website's DNS settings:
