# Using Batch Sizes when entering Bill of Materials

All Orders now supports Batch Sizes for easier entering of component quantities when setting up BOMs. While in most instances the quantities for components needed to build an assembly are entered based on what is required to build a single assembly, some BOMs may be setup with quantities needed to build more than a single assembly.

Instead of needing to do the math to find out what the quantities would be to build a single assembly, users can now set a Batch Size for the assembly in the BOM entry screen and then enter the quantities for the components based on that batch size. Once that assembly is saved the next time is placed on a work order All Orders will do the math for the user and will deduce how much of the components is needed to build any quantity of the assembly entered onto a work order.
